Week 8 ()

Thank you for taking the Week 11 : Assignment 11.

Week 11 : Assignment 11

Your last recorded submission was on 2025-10-08, 21:21 IST Due date: 2025-10-08, 23:59 IST.

Many repetitive online tasks can be automated using Python's **Selenium** library.

For example, logging into a website daily to check a dashboard can be automated with just a few steps.

First, install Selenium by running:

```
pip install selenium
```

Next, download the **Chrome WebDriver** that matches your version of Chrome.

To start writing the script, import the necessary modules:

```
from selenium import webdriver
from selenium.webdriver.common.by import By
from selenium.webdriver.common.keys import Keys
import time
```

Launch the Chrome browser:

```
driver = webdriver.Chrome()
```

Open the target website:

```
driver.get("https://www.sales-dashboard.com")
```

- Fun with Calendar - Part 02 (unit?unit=227&lesson=233)
- Fun with Calendar - Part 03 (unit?

Suppose the login form has two input fields:

- Username with id="username"
- Password with id="password"

Enter the credentials:

```
driver.find_element(By.ID, "username").send_keys("user123")
driver.find_element(By.ID, "password").send_keys("mypassword")
```

Submit the form by simulating the **Enter** key:

```
driver.find_element(By.ID, "password").send_keys(Keys.ENTER)
```

Since the page may take time to load, pause execution briefly:

```
time.sleep(5)
```

Finally, close the browser:

```
driver.quit()
```

By following these steps, a Python script can automatically log into a website, eliminating the need for manual browser interaction.

1) Which Python library is used in the passage to automate browser tasks? ***1 point***

- (•) Selenium
- ( ) BeautifulSoup
- ( ) Requests
- ( ) Pandas

2) Which command installs the Selenium library? ***1 point***

- ( ) install selenium
- (•) pip install selenium
- ( ) python -m install selenium
- ( ) pip get selenium

3) What is the purpose of webdriver.Chrome() in the code? ***1 point***

- ( ) To open a Firefox browser
- ( ) To install Chrome
- (•) To launch a Chrome browser instance

unit=227&lesson=234)
Fun with Calendar - Part 04 (unit?unit=227&lesson=235)
Fun with Calendar - Part 05 (unit?unit=227&lesson=236)
Fun with Calendar - Part 06 (unit?unit=227&lesson=237)
Fun with Calendar - Part 07 (unit?unit=227&lesson=238)
Fun with Calendar - Part 08 (unit?unit=227&lesson=239)
Fun with Calendar - Part 09 (unit?unit=227&lesson=240)
Fun with Calendar - Part 10 (unit?unit=227&lesson=241)
Fun with Calendar - Part 11 (unit?unit=227&lesson=242)
Fun with Calendar - Part 12 (unit?unit=227&lesson=243)

- To search Google

4) Which Selenium method opens a given URL in the browser? ***1 point***

- open()
- driver.load()
- driver.goto()
- driver.get()

5) In the example, what is the id of the username input field? ***1 point***

- name
- user
- username
- user_id

6) Which module provides the By class in Selenium? ***1 point***

- selenium.webdriver.common.by
- selenium.by
- webdriver.by
- selenium.common.by

7) What does send_keys(Keys.ENTER) simulate? ***1 point***

- Typing text
- Pressing the Enter key
- Clicking a button
- Submitting by mouse

8) Why is time.sleep(5) used in the script? ***1 point***

- To delay closing the browser until the page loads
- To speed up execution
- To refresh the page
- To avoid importing libraries

9) Which Selenium method closes the entire browser window? ***1 point***

- driver.close()
- driver.quit()
- browser.exit()
- webdriver.stop()

10) What is the main advantage of automating logins with Selenium? ***1 point***

Problem Solving Session - July 2025 ()

- (●) It saves manual effort
- ( ) It prevents internet outages
- ( ) It increases battery life
- ( ) It blocks ads

Python provides powerful tools for handling dates, times, and calendar-related tasks through the **datetime** and **calendar** modules.

1. The datetime Module

The datetime module contains several classes, such as:

- **date** – Represents a calendar date (year, month, day).
- **time** – Represents a time of day (hours, minutes, seconds, microseconds).
- **datetime** – Combines both date and time into one object.
- **timedelta** – Represents the difference between two dates or times.

To get the current date and time:

```
import datetime
now = datetime.datetime.now()
```

his returns an object containing year, month, day, hour, minute, and second.
To create a specific date:

```
d = datetime.date(2025, 8, 10)
```

You can extract components:

```
now.year, now.month, now.day
```

You can also format dates using strftime:
Here:

- %A → Full weekday name
- %d → Day of month (zero-padded)
- %B → Full month name
- %Y → Year with century

2. The calendar Module

The calendar module is useful for working with entire months or years. Example: Printing a month's calendar:

```
import calendar
print(calendar.month(2025, 8))
```

Checking if a year is a leap year:

Assessment submitted.
X

```
calendar.isleap(2024)  # Returns True
```

Getting the weekday of a given date:

```
calendar.weekday(2025, 8, 10)
```

11) Which function from datetime.date returns today's date? ***1 point***

- date.current()
- date.now()
- date.today()
- date.localtime()

12) What does %B stand for in date formatting? ***1 point***

- Abbreviated month name
- Full weekday name
- Full month name
- Day of the year

13) Which import statement allows direct use of date, time, and datetime without module prefix? ***1 point***

- import datetime
- from datetime import module
- from datetime import all
- from datetime import date, time, datetime

14) What type does calendar.isleap() return? ***1 point***

- Integer
- String
- Boolean
- Float

15) Which symbol in strftime gives a zero-padded day of the month? ***1 point***

- %B
- %A
- %d
- %m

16) If calendar.weekday(2023, 12, 31) returns 6, what day is that? ***1 point***

Assessment submitted.
X

- Saturday
- Monday
- Friday
- Sunday

17) What will datetime.timedelta(days=10) create? ***1 point***

- A future date 10 days later
- A calendar for 10 months
- A list of 10 dates
- A time duration of 10 days

18) Which strftime code outputs a 24-hour format hour? ***1 point***

- %I
- %H
- %p
- %h

19) What will datetime.date.today().weekday() return if today is Friday? ***1 point***

- 6
- 1
- 4
- 5

20) Which module provides functions like isleap() and month()? ***1 point***

- calendar
- datetime
- time
- math

You may submit any number of times before the due date. The final submission will be considered for grading.
